Time Elapsed vs. Matrix Size

Quintin Davis

2/17/14

1) L1: 32KB L2: 256 KB L3: 8MB

2) As caches get full, the operations per second decrease. However, the L1 cache is an exception because of its small size, factors other than cache misses play a larger role in the overall time required.

3) From looking at the col ordered and row ordered programs, it is apparent that ordering the matrix in the same way it is read is important. Strassen multiplication of the matrices was found to be significantly faster than the other methods at large matrix sizes.
